Gemini	25.0%	2 / 8	—
Claude	25.0%	2 / 8	—

Strategic Summary

Herbs of Gold – March 2024 AI Visibility Report

Your brand is functionally invisible in Malaysia's AI search landscape. With an overall visibility score of approximately 25% (appearing in just 4 of 16 web-grounded queries across Gemini and Claude), Herbs of Gold is absent from the conversations that matter most—category searches, condition-specific queries, and competitive comparisons. You failed to appear in "best health supplement brands in Malaysia," "best halal vitamin brands," and critically, the head-to-head "Blackmores vs Herbs of Gold" query. When consumers ask AI engines where the category is going, your brand isn't part of the answer.

The 0% Source Impact Rate is the more urgent problem. In the four instances where Herbs of Gold *was* mentioned, herbofgold.com.my was never cited as the authoritative source. AI models are instead referencing listicles, aggregator sites, and competitor domains to answer questions about *your own products*. You're being discussed, but not owned. This means you're earning no authority signal, no referral consideration, and no control over the narrative when your brand does surface. The net +100 sentiment is hollow without source attribution—it's borrowed credibility, not built equity.

Your absence from condition-specific queries (PCOS, menopause, sleep support) signals a content and semantic gap. These are high-intent, high-value searches where Australian practitioner-grade positioning should give you an edge, yet you're not even in the consideration set. Competitors and generic listicles are filling the void. The Malaysian market is clearly underserved in AI-optimized content that connects therapeutic-grade supplementation to real health outcomes, and you're not capitalizing.

Three Priority Actions for April:

- Publish 6–8 condition-specific landing pages** (PCOS, menopause, sleep, immunity, women's health) with clinical evidence, ingredient breakdowns, and product recommendations. Optimize for entity salience: use structured data, clear H1/H2 hierarchies, and FAQ schema targeting question-based queries. Goal: become the cited source when AI answers "best supplement for [condition] in Malaysia."
- Build 10–15 authoritative backlinks** from Malaysian health publishers, pharmacist blogs, and wellness platforms that AI models crawl regularly (e.g., HelloDoktor, HealthLoco, pharmacy partner sites). Include brand mentions + domain links in educational content. This directly improves your likelihood of being cited as a source, not just mentioned.
- Create a dedicated /compare/blackmores-vs-herbs-of-gold page** with an honest, evidence-based comparison table covering formulation, sourcing, certifications, and value. AI models reward transparent comparative content. Failing to appear in your own brand comparison query is a missed conversion opportunity—own that narrative before competitors do.

Visibility scores reflect the percentage of tracked prompts in which Herbs of Gold's brand appeared in responses from ChatGPT, Google Gemini, and Claude. Scores are approximate indicators derived from live API calls — AI models are non-deterministic and results may vary between runs. No data in this report is fabricated or estimated.
